BharatMitra AI: A Sovereign, Transactional National Single-Window for India's Citizen Services

Proposal for strengthening India Stack - inspired by the United States' America.gov (launched 29 September 2026)

Addressed to:

- The Hon'ble Prime Minister's Office, Government of India
- The Hon'ble Chief Minister, Government of Telangana
- The Hon'ble Chief Minister, Government of Andhra Pradesh

Date: 30 September 2026

Prepared by: Viswa Anoop Nerella (NRI, Hyderabad)

---

1. Executive Summary

On 29 September 2026, the United States launched America.gov - an AI chatbot that unifies ~29,000 federal agency websites into one conversational "front door" for citizens, backed by an executive order mandating agency integration. At launch it is information-only: it answers questions but cannot complete transactions; passports go online only in December 2026, and apply/enroll/track functions arrive in 2027. It runs on foreign commercial models (Google's Gemini and xAI's Grok), supports voice in three languages, and excludes tax filing and national-security services.

India can - and should - leapfrog this. India Stack is already deeper than anything America.gov rests on: Aadhaar's 1.4-billion identity base, DigiLocker's issued-document vault, UMANG's thousands of live services, Bhashini's 22-language voice infrastructure, and the National Single Window System's API fabric. This proposal asks the Centre and the States to launch BharatMitra AI - a national Sovereign Intelligence (SI) chatbot that doesn't just *answer* citizens, it completes their work: one voice/text query in any scheduled language, authenticated via Aadhaar, documents pulled from DigiLocker, multi-level approvals orchestrated across central and state APIs, real-time status, and automatic clearance of routine cases. No human discretion where rules suffice. No intermediaries. No bribes. Immutable audit trails and continuous SI safety monitoring underneath everything.

The concrete ask: a national mandate (on the lines of the U.S. executive order) plus Telangana and Andhra Pradesh as the two pilot states proving centre-state, multi-department orchestration first.

---

2. The Global Moment: What America Did

The facts of the American launch, verified from launch-day reporting:

- Launch: 29 September 2026, announced by the U.S. President at the Mellon Auditorium, Washington D.C. - "one front door for every single question." (TechCrunch, 29 Sept 2026)
- Scale: ~29,000 federal websites consolidated into one chatbot interface, operated by the General Services Administration and built by the White House's National Design Studio. (Healthcare IT News)
- Legal teeth: an executive order, *Streamlining Access to Government Services Through America.gov*, designates it "the unified digital front door to the federal government" and orders federal agencies to integrate - distinguishing it from a typical redesign. It covers services with more than 100,000 users a year. (SecurityBoulevard)
- Models: powered by Google's Gemini and xAI's Grok; Google confirmed technology partnership. Citizens

can ask plain-language questions, get source citations, upload government PDFs for Q&A, and use voice in English, Spanish, and French. (The News / Herald Business)

- Limits: information only - it cannot submit forms, process applications, or handle renewals today. Online passport applications begin December 2026; apply/enroll/track inside chat arrives in 2027 ("Phase 2"). Identity will eventually flow through Login.gov. IRS tax filing and national-security-sensitive services are excluded. (SecurityBoulevard; WSJ via Herald Business)

- Criticism: hallucinations remain a real risk - critics note AI errors in citizen-facing systems can mean missed deadlines, denied benefits, or penalties. (TechCrunch)

India's reading: America.gov proves the *concept* of the AI front door and gives it executive force. But it is a thin layer over foreign models, monolingual in practice, and transactional capability is still a roadmap. India can launch already transactional, already multilingual, already sovereign.

---

3. India's Opening: The Stack Is Ready

America.gov had to *build* its foundations. India already owns the layers America lacks:

India Stack layer | What it gives BharatMitra

Aadhaar + Jan Parichay/MeriPehchaan SSO | Instant, fraud-resistant authentication - the equivalent of Login.gov, already universal

DigiLocker | Issued, verifiable documents (birth, degree, licence, land records) - no scanning, no forgery

UMANG | Thousands of live central/state services to absorb into the conversational layer

Bhashini (National Language Translation Mission) | Voice + text in all 22 scheduled languages - 7× the language reach of America.gov

NSWS (National Single Window System) | The API-fabric model: single-window orchestration across ministries - extend from investor approvals to citizen services

UPI / ONDC / Account Aggregator | Payments and data-sharing rails already proven at national scale

DPDP Act, 2023 | A consent-based data-governance frame America.gov's launch lacks

No other country has all of these in one hand. This is a once-in-a-generation window.

---

4. The Proposal: BharatMitra AI

4.1 The idea in one line

A national Sovereign Intelligence chatbot - hosted by the Government of India, extended from UMANG and Bhashini - that takes a citizen's voice or text query in any of 22+ languages and completes the service end-to-end, across central and state departments, without the citizen ever touching a form, an office, or an intermediary.

4.2 Architecture (six layers)

- SI core (sovereign by design): a BharatGen-class sovereign language model, trained and hosted on Indian infrastructure, with full data residency in India. Unlike America.gov's dependence on Gemini/Grok, the model weights, training data governance, and inference remain under Indian control. Open, auditable model cards published per release.

- Language layer (Bhashini × UMANG): extend UMANG's service catalogue into conversational intents; extend Bhashini's speech-to-text, translation, and text-to-speech into the chatbot's front door. A farmer in Warangal speaks Telugu; a pensioner in Tirupati speaks Telugu too; a migrant worker speaks Hindi - all

reach the *same* service graph.

- Integration fabric (NSWS extended): every central ministry and state department exposes its services as standard APIs on a national service bus - modelled on NSWS but for citizen services, not just investor approvals. One query ("I want to start a food stall near my village") fans out to FSSAI licensing, municipal trade licence, Udyam registration, and state labour permits as a single orchestrated workflow, with the chatbot resolving which level of government owns each step.

- Identity + documents: Aadhaar-based e-KYC/auth (OTP, face, or fingerprint per risk level) via the national SSO; documents auto-fetched as *issued* records from DigiLocker. The citizen never uploads what the state already issued.

- Automation engine: real-time status tracking by default; auto-clearance of routine cases where published criteria are fully met (e.g., renewal with unchanged facts, no dues, valid documents) - "deemed approval" within SLA, no officer's signature required. Human officers handle only exceptions, appeals, and genuinely discretionary decisions.

- Trust layer: immutable, hash-chained audit trails for every application, decision, and data access - tamper-evident and independently auditable. SI safety monitoring runs continuously: hallucination guards (every AI-drafted answer cites the exact rule/notification), red-teaming of the model, confidence thresholds that escalate to humans, and rollback of any automated decision on appeal.

4.3 What changes for the citizen

- Before: visit office ? find the right form ? attach xeroxes ? pay the "agent" ? return in 15 days ? bribe to move the file.

- After: speak one sentence ? Aadhaar-confirmed ? documents fetched ? approvals orchestrated ? status on phone ? certificate in DigiLocker.

Human discretion is removed where rules suffice; intermediaries have nothing left to intermediate; bribes lose their point of sale.

4.4 The states plug in - Telangana and Andhra Pradesh first

Federalism is the reason India must go beyond America.gov's single-government design. The proposal:

- Centre (MeitY/Digital India): hosts BharatMitra AI, the SI core, the national service bus, and the audit infrastructure; issues the integration mandate.

- States: expose departmental APIs (revenue, municipal, transport, labour, agriculture, education) to the bus; map their schemes and forms to national intents. Telangana and Andhra Pradesh - with mature digital service delivery (MeeSeva/T App Folio; AP Seva Portal) and a shared Telugu-language base for the first Bhashini-grade conversational rollout - serve as pilot states, proving centre + state + local orchestration before national scale.

- Citizens keep one identity, one conversation, one tracker - regardless of which tier of government acts.

---

5. Why BharatMitra Beats America.gov - Head to Head

Dimension | America.gov (USA, launched 29 Sept 2026) | BharatMitra AI (proposed)

Capability at launch | Information only; transactions from 2027 | Transactional from day one

Intelligence | Foreign commercial models (Gemini, Grok) | Sovereign Intelligence, hosted in India

Languages | 3 (voice) | 22+ scheduled languages (voice + text)

Identity | Login.gov (future integration) | Aadhaar + national SSO (already universal)

Documents | Citizen uploads PDFs | DigiLocker issued documents, auto-fetched

Integration | Federal agencies, EO-mandated | Centre + states + local via extended NSWS APIs

Discretion removal | Not addressed | Auto-clearance of routine cases; audit-chained

Safety | Hallucination concerns noted by press | SI safety monitoring, red-teaming, human escalation

---

6. Implementation Roadmap (18 months)

- Phase 0 - Mandate & standards (Months 1-3): national directive on the lines of the U.S. executive order; publish API and audit-trail standards; constitute the SI safety board (MeitY, UIDAI, CERT-In, academia, civil society).

- Phase 1 - Core + pilots (Months 4-9): SI core trained/hardened; UMANG × Bhashini conversational layer live in Telugu, Hindi, English first; Telangana and Andhra Pradesh onboard 10 high-volume services each (e.g., income/caste certificates, trade licences, driving-licence services, pensioner life-certificate, building permissions) on the extended NSWS bus with end-to-end orchestration.

- Phase 2 - Scale languages & services (Months 10-15): all 22 scheduled languages; 500+ services; auto-clearance rules published department-wise; immutable audit live and open to CAG-grade audit.

- Phase 3 - National rollout (Months 16-18): all states onboarded; grievance/appeal loop inside the chatbot; public dashboard of SLAs, clearance times, and bribe-reporting outcomes.

7. Indicative Budget & Resourcing

(Estimates only - detailed costing by MeitY/NICSI in Phase 0.) Core SI training and hosting, language-layer expansion, integration engineering for pilot states, safety/red-team programme, and change management across departments: on the order of Rs. 300-500 crore over three years, substantially offset by collapsing duplicated departmental portals, apps, and call centres into one maintained stack. States contribute API-integration engineering; the Centre funds the SI core and audit infrastructure as national public digital infrastructure.

8. Risks & Mitigations

- Digital divide: voice-first design, assisted kiosks at Common Service Centres, and IVR fallback so the chatbot serves the non-literate, not just the smartphone user.

- Privacy: DPDP Act consent architecture; data minimisation; on-device processing where feasible; no commercial use of citizen data - a harder guarantee than America.gov's commercial-model base.

- Model safety: the SI safety monitoring layer (Section 4.2.6) - hallucination guards, confidence-gated human escalation, full red-teaming, and published incident reports.

- State buy-in: pilot-first proof in Telangana and Andhra Pradesh; integration funded centrally in Phase 1; no state asked to retire working systems on day one.

- Legacy IT: NSWS-style API adapters wrap legacy departmental systems - departments modernise behind a stable interface.

9. Success Metrics (published quarterly)

- Median time-to-service per department (target: 80% of routine cases auto-cleared within SLA)
- Share of applications completed without any office visit or intermediary
- Bribe-demand reports per 10,000 transactions (target: measurable decline vs. baseline survey)
- Citizen satisfaction and grievance-resolution time
- Audit-trail completeness and independent audit pass rate

---

10. Suraksha Kavach & Paathshala - Protecting Assets, Building Literacy

Service delivery is only half the mission. India's financial-literacy gap - from wealthy to poor, and worst among the elderly and rural citizens - makes ordinary people prey for fraud and silent victims of missing paperwork. BharatMitra therefore ships two citizen-protection missions on the same rails:

10.1 Suraksha Kavach (protection shield)

- Land Vault (Bhoo-Suraksha): Aadhaar-linked registration of survey numbers via Dharani / MeeBhoomi / state registries. Any sale, mortgage, or mutation attempt triggers an instant alert in the citizen's language; an optional Freeze means no registration completes without the owner's live biometric consent - killing impersonation fraud against the elderly. Built on Dharani/MeeBhoomi, the CERSAI security-interest registry, Aadhaar face authentication, and DigiLocker deeds.
- Account Shield (Dhan-Suraksha): a consent-based single dashboard of all bank accounts via the RBI's Account Aggregator framework. Learns normal patterns; alerts on large debits, new payees, or SIM-change + UPI activity. Citizens may nominate a trusted contact (alerted, never given control) and seniors get a 24-hour cooling period on new beneficiaries plus big-text, slow-voice confirmations.
- Scam Radar: "verify before you pay" - check any UPI ID, phone number, or link against reported-fraud databases; learn the 12 most common fraud playbooks as 30-second audio stories in the citizen's language; one-tap reporting to the 1930 National Cyber Helpline with details auto-filled. Built with Sanchar Saathi (DoT) data and Bhashini.
- Vaaris (nominee & heir helper): scans accounts, deposits, policies, and EPF for missing nominees - the single biggest cause of post-death family hardship - then guides e-nomination in the citizen's language and prepares legal-heir / succession certificate flows.

10.2 Paathshala (financial literacy in rural languages)

Audio-first, 2-3 minute lessons in every scheduled language (Telugu/Hindi/English first), organized into tracks - Seniors (60+), Rural first-time users, Women & SHG members, Youth. Launch curriculum: OTP = your signature; UPI safety; nominees; interest & compounding; insurance vs. investment; the KYC/customer-care fraud playbook; government safety nets (PMSBY, PMJJBY, APY); reading your land record (pahani/khata). Every lesson ends with a one-question quiz; a weekly "scam story" in the citizen's language keeps the whole family alert.

10.3 Why this belongs in the national proposal

Fraud losses and land disputes are a governance problem, not just a consumer problem - they destroy trust in digital

India itself. A sovereign assistant that only *delivers* services but doesn't *protect* the citizen's assets and *teach* in her language leaves the most vulnerable behind. Suraksha Kavach and Paathshala reuse the same six-layer architecture (Section 4.2): no new stack, only new missions.

---

11. The Ask

- PMO / Government of India: issue a national directive establishing BharatMitra AI as the unified AI front door for citizen services, with a binding integration timeline - India's answer to America's 29 September executive order, but transactional from launch and sovereign by design.
- Government of Telangana and Government of Andhra Pradesh: sign on as the two pilot states - expose priority departmental APIs, co-design the Telugu-first conversational rollout, and demonstrate centre-state orchestration for the country.
- MeitY / Digital India Corporation: constitute the SI safety board and publish the API, audit, and auto-clearance standards in Phase 0.

America launched the front door yesterday. India can open a better one - sovereign, multilingual, and actually completing the citizen's work. The stack is built. The moment is now.
